

	Scientific statement	Observed implementation or released artifact	Comparison	Available evidence	What the evidence shows
AgentPRM equation / value	terminal-relative discount equation	implementation uses a forward exponent	mean 0.42550 → 0.34875	released training traces unavailable	controlled values change; effect on reported results cannot be determined
ContractBench logging / aggregate	Qwen3.5-9B n=99; 56.6%	released artifact n=99; 0/99	model name and n=99 match; checkpoint, task set, and configuration not verified	99 released traces; 3 report output tokens but have no terminal response	0/99 released successes vs 56.6% reported under the repository mapping; historical performance cannot be reconstructed
ToolACE coordinate / support	post-crop mask coordinates	implementation retains 0 supervised tokens	corrected coordinates retain 4	9,412/10,092 parsed; 0 exceed 8,192; maximum observed: 3,945	defect not activated among parsed released targets
AgentAbstain metric / aggregation	macro over 8 scenarios	equal subtype weighting produces 0.750	pair-weighted alternative produces 0.625	released model outputs unavailable	within-scenario weighting is not specified; no discrepancy
